

Ecosystem services within and outside of protected areas: The Swiss National Park and Davos

Adrienne Grêt-Regamey
Ana Stritih

Mountain ecosystems

Climate change

Carbon sequestration

Protection from natural hazards

Timber

Food

Habitats

Land use change

Cultural services

Mountain ecosystems: Management

Societal and management responses:

- Spatial planning
- Forest management
- Agricultural policy
- Protected areas

Including the ecosystem service concept into decision making:

- Spatially explicit assessments of ES
- Trade-offs

How do protected areas influence the supply and demand for ecosystem services?

- Comparison of PA and non-PA

Swiss National Park

- Established in 1914
- Strict reserve (IUCN Kat. Ia)
- 3 main objectives:
 - Protecting natural processes
 - Research
 - Informing visitors

Swiss National Park

- Established in 1914
- Strict reserve (IUCN Kat. Ia)
- 3 main objectives:
 - Protecting natural processes
 - Research
 - Informing visitors

alpen.sac-cas.ch

Landschaft Davos

- Touristic main valley
- Three side valleys dominated by mountain agriculture
- 13 000 inhabitants
- 25 000 guest beds

Landschaft Davos

- Touristic main valley
- Three side valleys dominated by mountain agriculture
- 13 000
- 25 000

- What are the **uncertainties** related to the provision of ecosystem services under different scenarios?
- What are the **trade-offs** between ecosystem services in mountain regions?
- How do protected areas affect the supply, demand, and trade-offs between ecosystem services?

Climate change

Protection from natural hazards

Carbon sequestration

Timber

Food

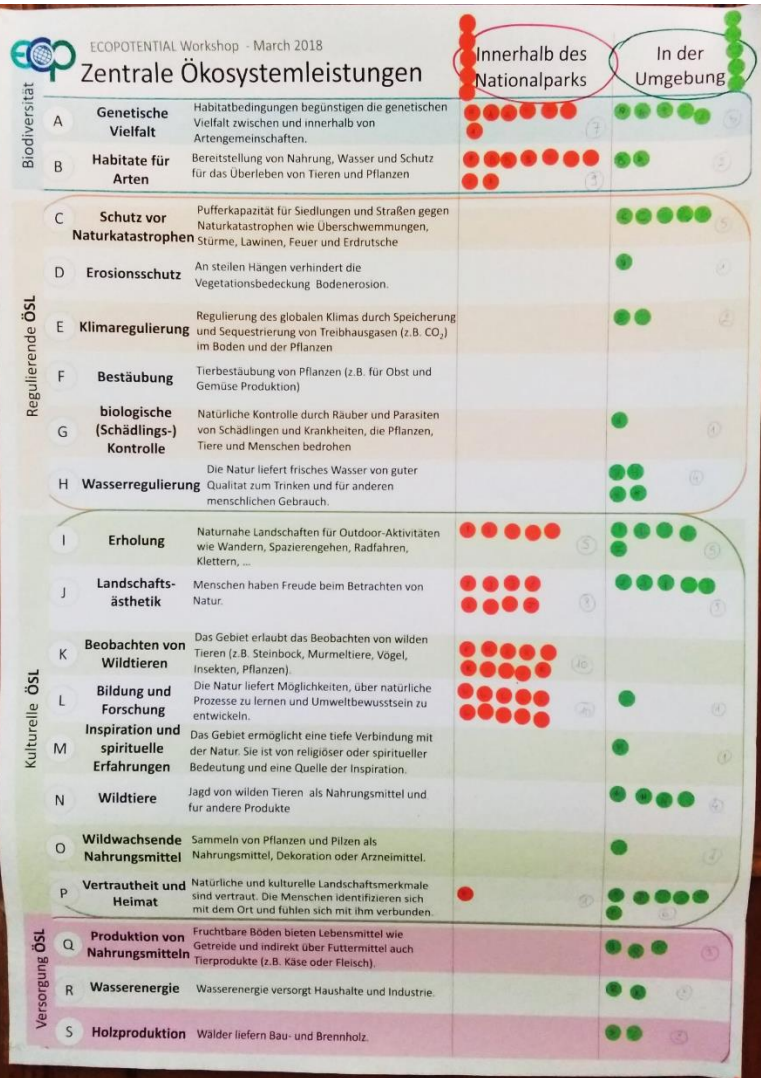

Habitats

Land use change

Cultural services

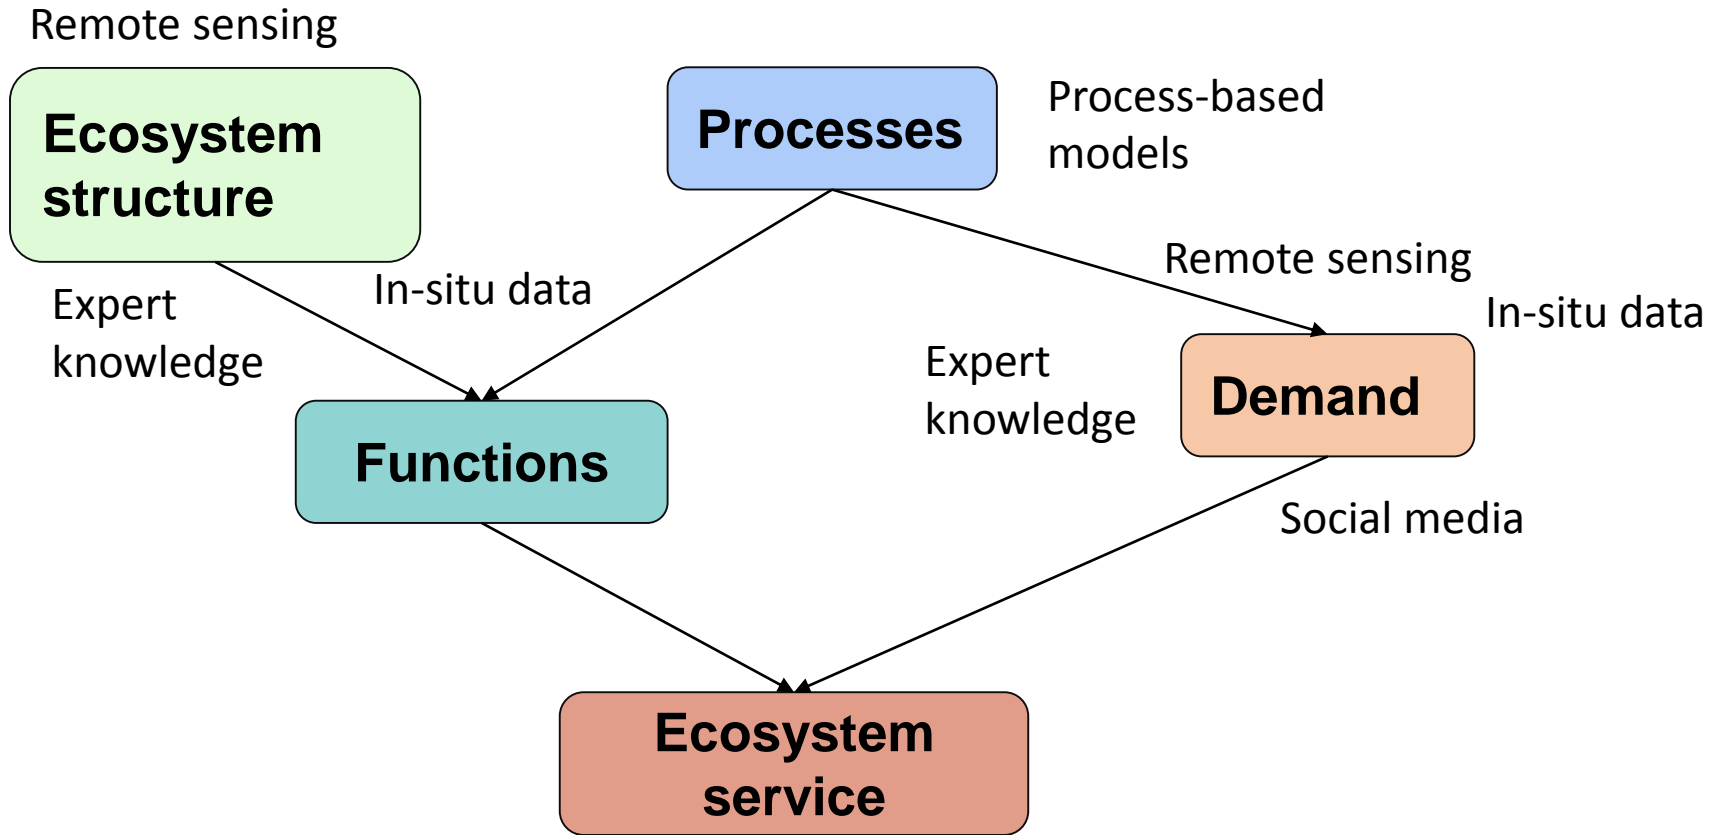

Workshop in the Swiss National Park

- Participants from PA management, municipality, tourist organisation
- Most important ecosystem services?
 - Inside and outside the park

Category	Ecosystem service	In the Park	In the surroundings of the Park
Biodiversity	A - Genetic resources	7	5
	B - Habitats for species	9	2
Regulating services	C - Protection against natural hazards	0	5
	D - Erosion prevention	0	1
	E - CO2 sequestration	0	2
	F - Pollination	0	0
	G - Biological control	0	1
	H - Water regulation	0	4
Cultural services	I - Recreation	5	5
	J - Scenic beauty	8	5
	K - Wildlife observation	10	0
	L - Research and education	10	1
	M - Inspiration and spiritual experience	0	1
	N - Wild animals	0	4
	O - Wild plants and mushrooms	0	1
	P - Identification	1	6
Provisioning services	Q - Agricultural production	0	3
	R - Hydro-energy	0	2
	S - Wood production	0	2

- Integrating different types of data
- Uncertainties

Bayesian Networks

Provision

Snow stopped [m]

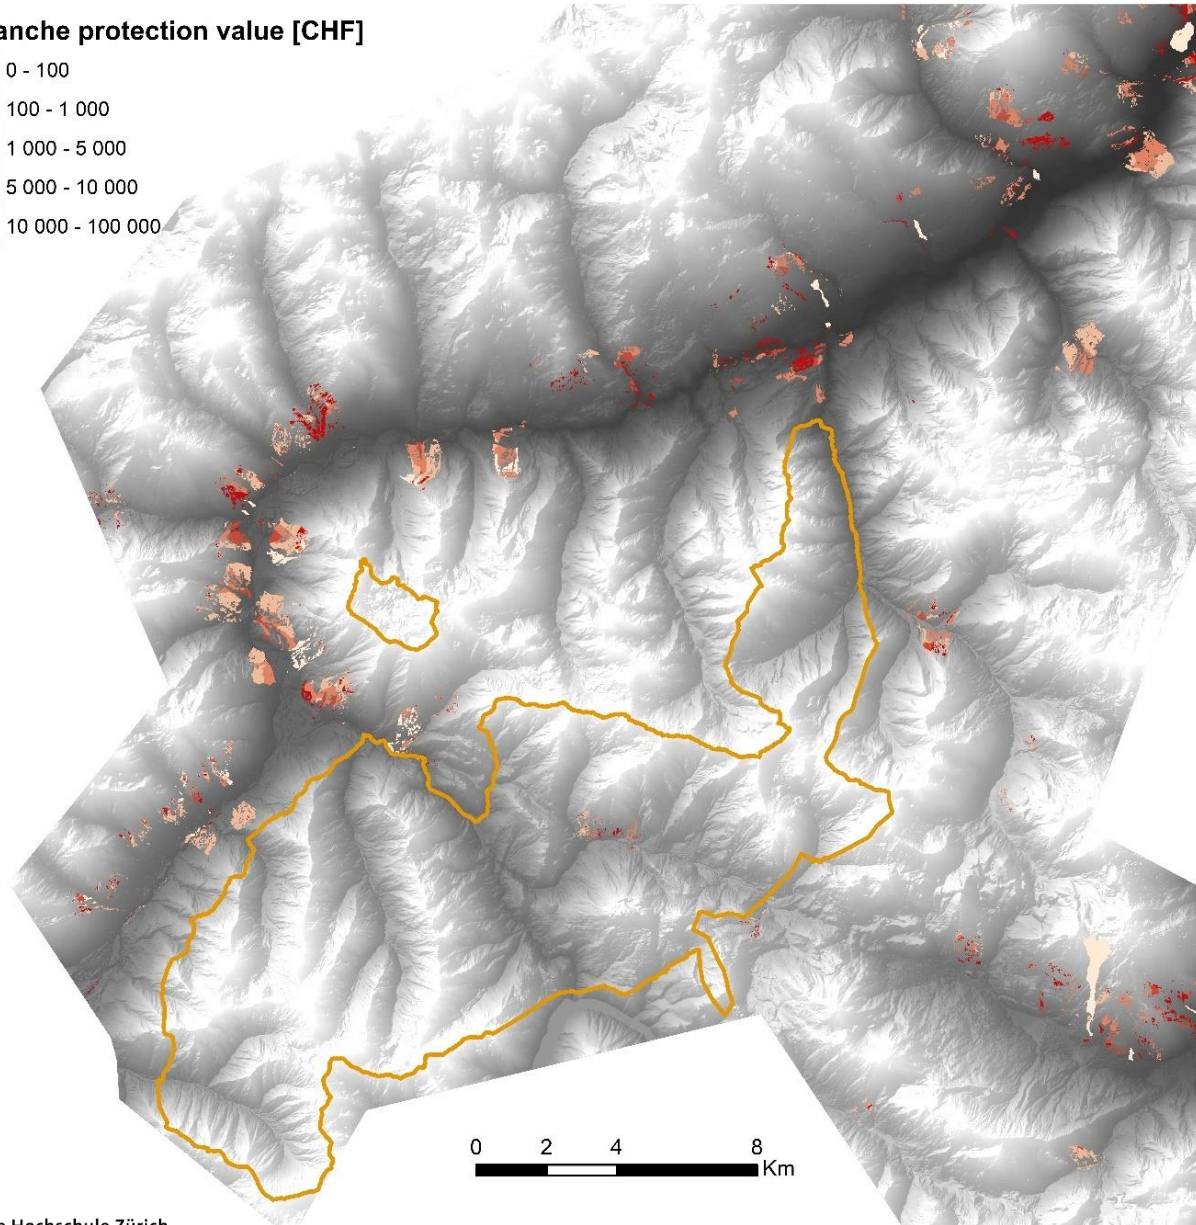

Demand

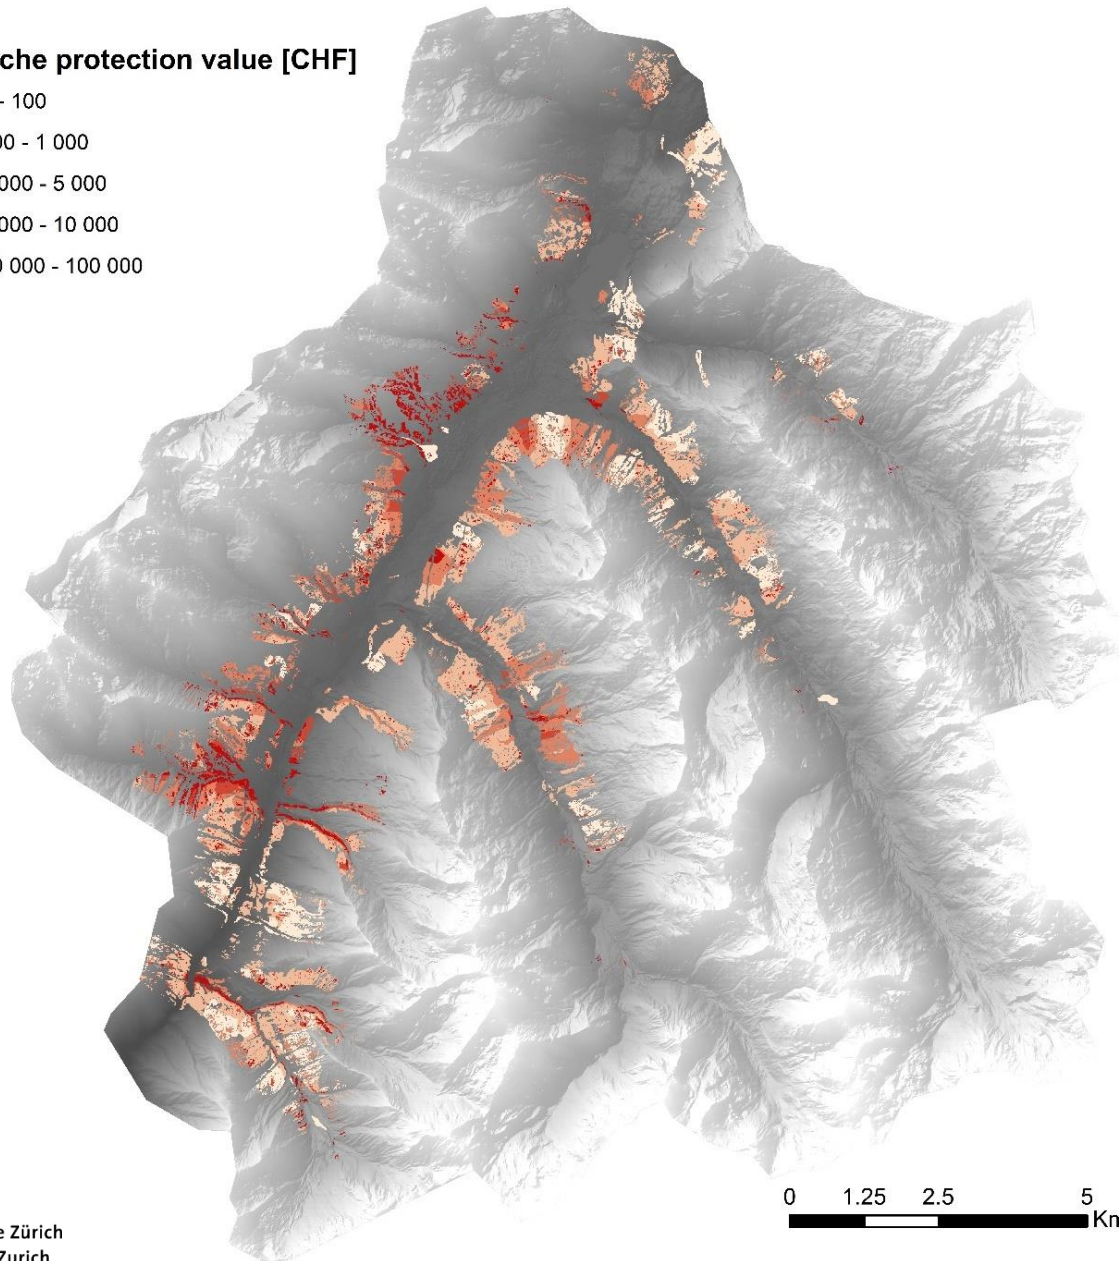

Demand [CHF]

Avalanche protection value [CHF]

Avalanche protection value [CHF]

- Ongoing work on modelling recreation, habitats, and carbon sequestration
- What we've learned so far:
 - Spatial Bayesian Networks can integrate different types of information on ecosystem services
 - High uncertainties about ecosystem processes (disturbances)
 - Management objectives and local differences in demand affect the value of ecosystem services

Thanks!
