The relationship between ecosystems provisioning on cultural services (tourism)

- Aim at development an environment to help management to relate the natural productivity of ecosystems to cultural services
- Our belief is that the quality of water is reflected by the aquatic ecosystems productivity.
- Productive systems are attracting fish-eating birds, that are attracting birdwatchers and leisure fishermen.
- Natural landscape and sea-side is another attraction type.

The relationship between ecosystems provisioning on cultural services (tourism)

- Plenty of data from various sources/studies/monitoring
- Hard to find direct relations among these datasets

Solution:

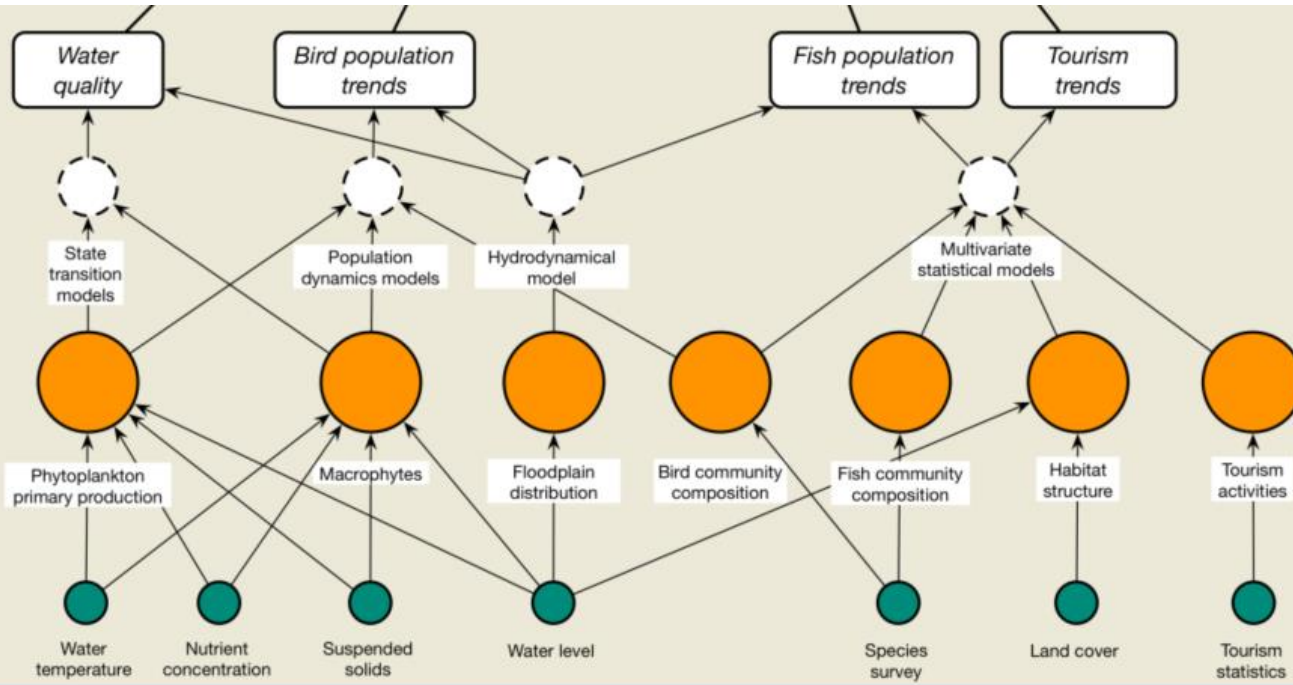

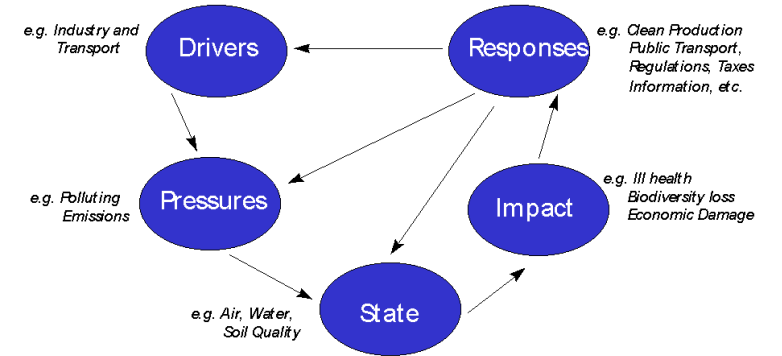

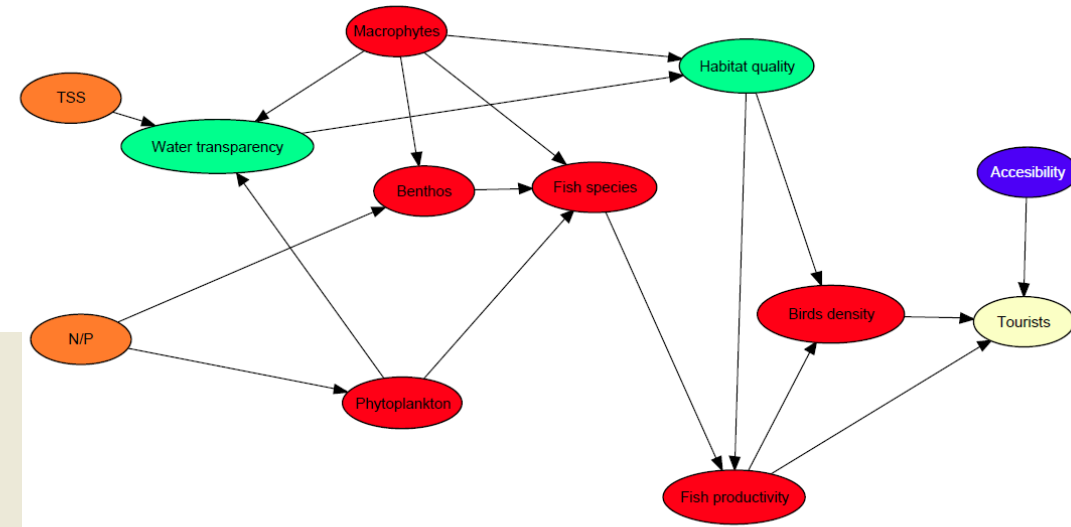

- We developed a Bayesian Belief Network
- We assessed the potential of ecosystem to produce services
- We used social media to assess the cultural services based on the pictures tourists/visitors are taking

Danube Delta - DPSIR

This project has received funding from the *European Union's Horizon 2020 research and innovation programme* under grant agreement No 641762

Complex mind map

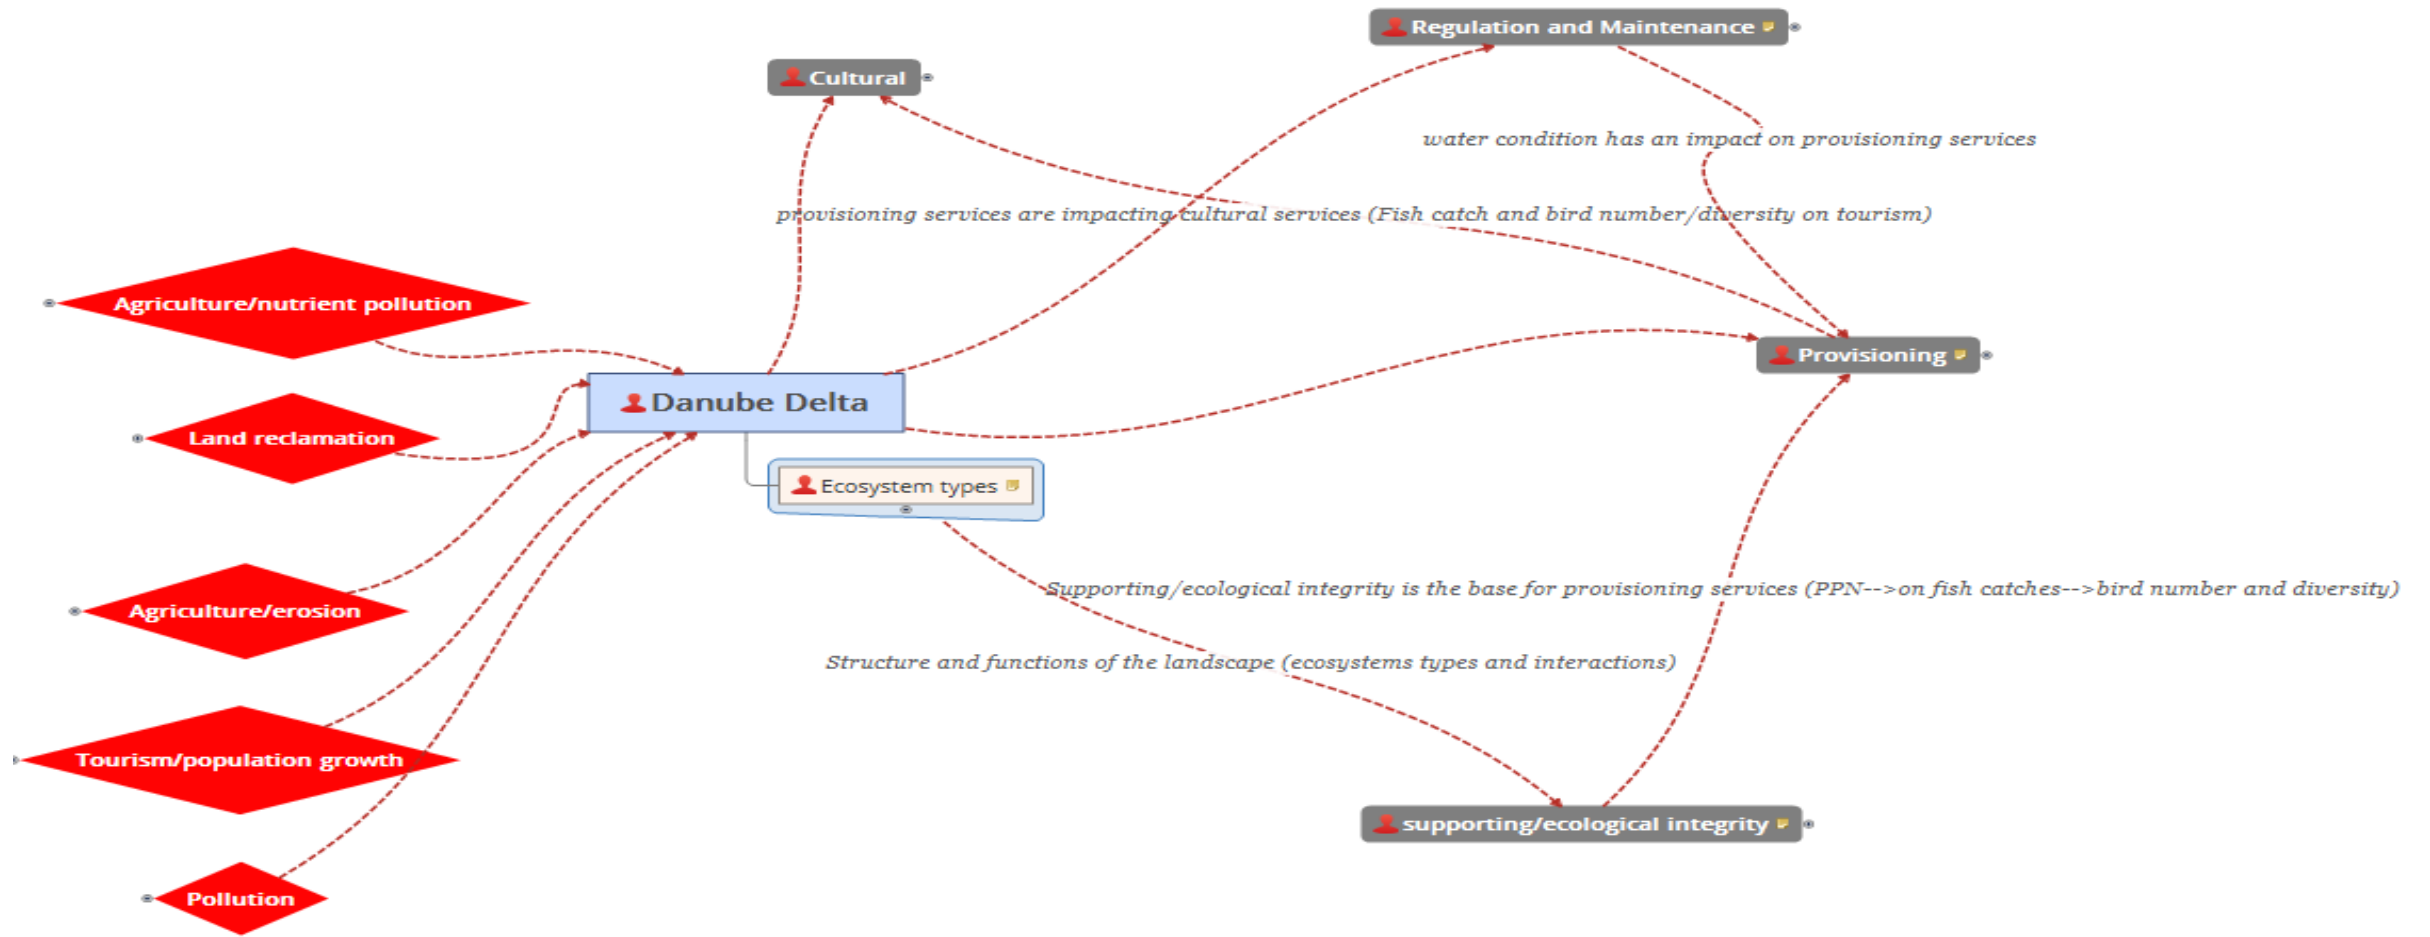

Difficult to work with...

This project has received funding from the *European Union's Horizon 2020 research and innovation programme* under grant agreement No 641762

Simplified Mind Map

Working with concepts

University of
Bucharest (UB)

- Starting from a narrative description (the storyline) translated into a Mind Map and finally into a BBN.

In building up the BBN we have used the concept of DIPSIR

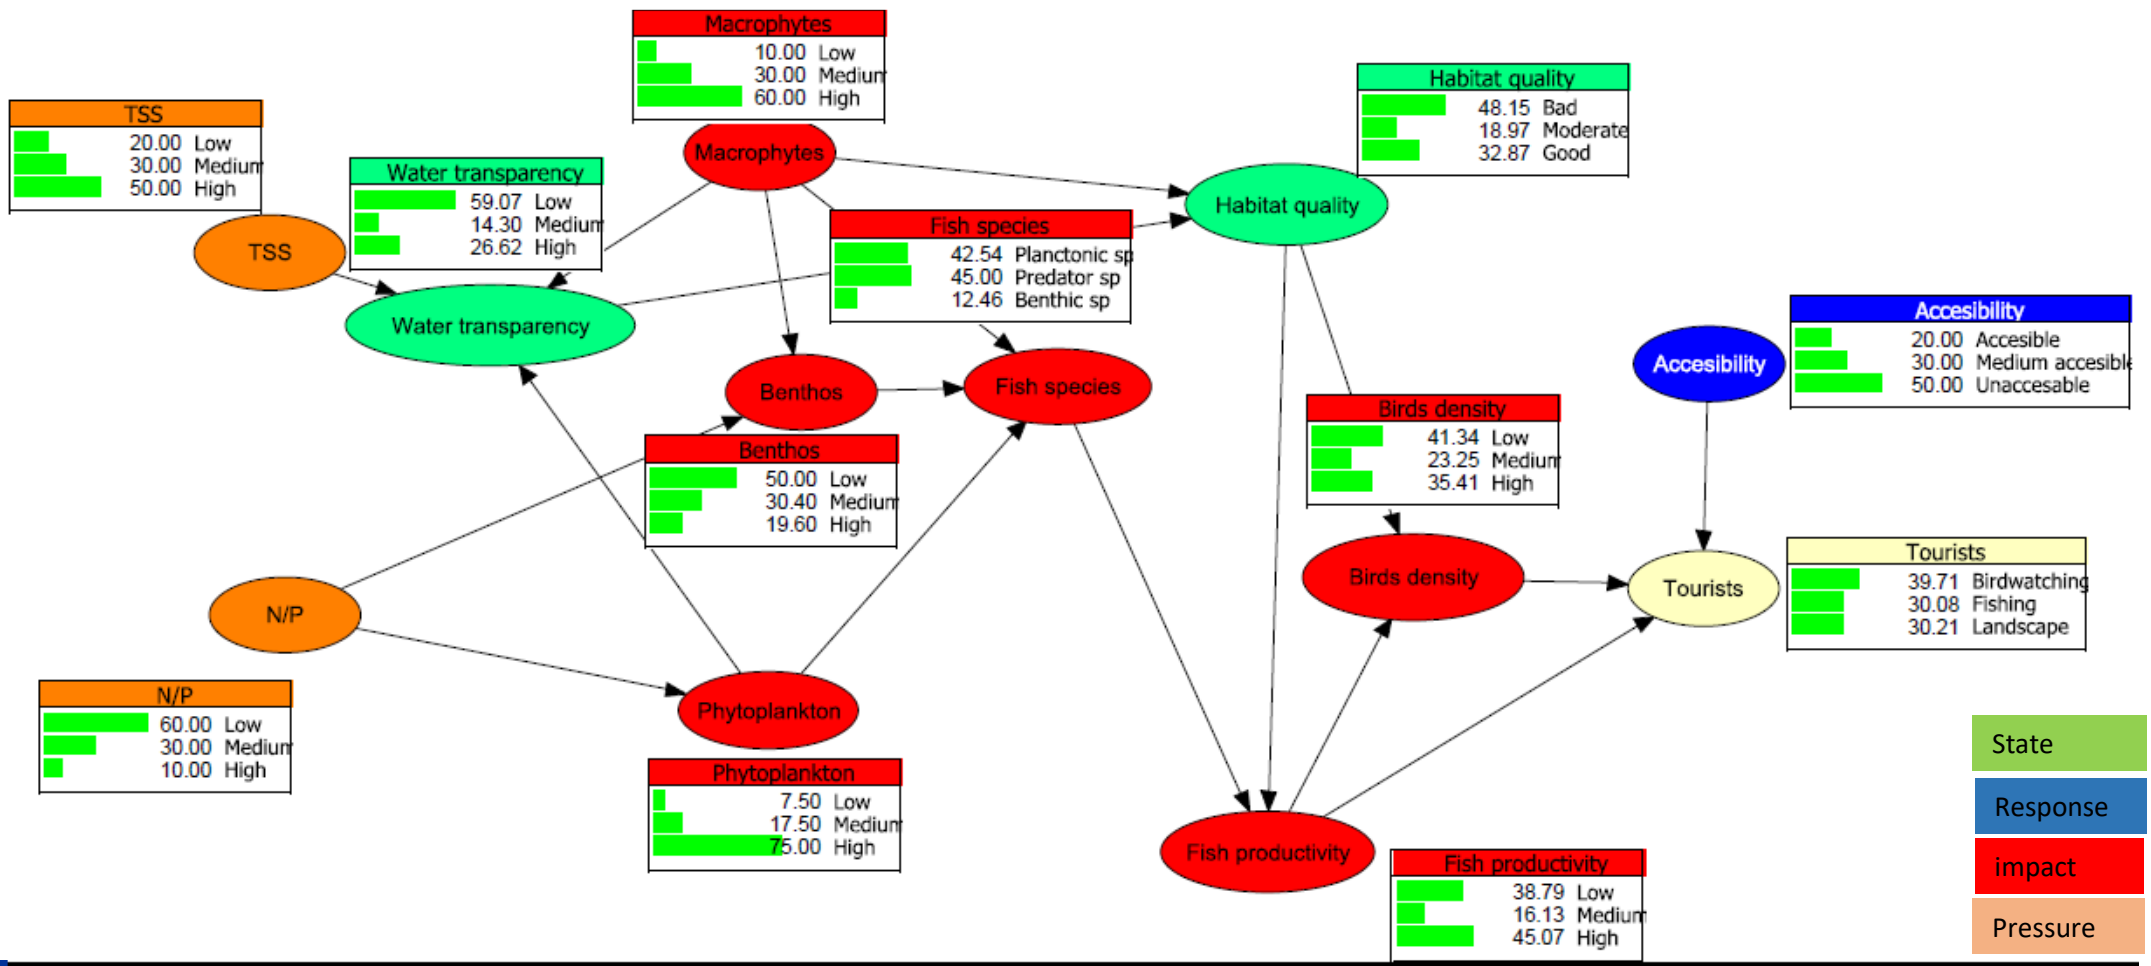

- **Pressures:** - *N/P, nitrogen phosphorous ratio, TSS;*
- **Impact:** - *Phytoplankton, Fish species, Fish productivity, Bird density, Macrophytes, Benthos;*
- **Status:** – *Habitat quality, Water transparency;*
- **Response:** - *Accessibility*). We also considered that some of the concepts used could be classified as production ES (*Fish productivity*), regulation services (*N/P, Water transparency, Habitat quality*), Supporting services (*Macrophytes*) and cultural services (*tourism*).

This project has received funding from the *European Union's Horizon 2020 research and innovation programme* under grant agreement No 641762

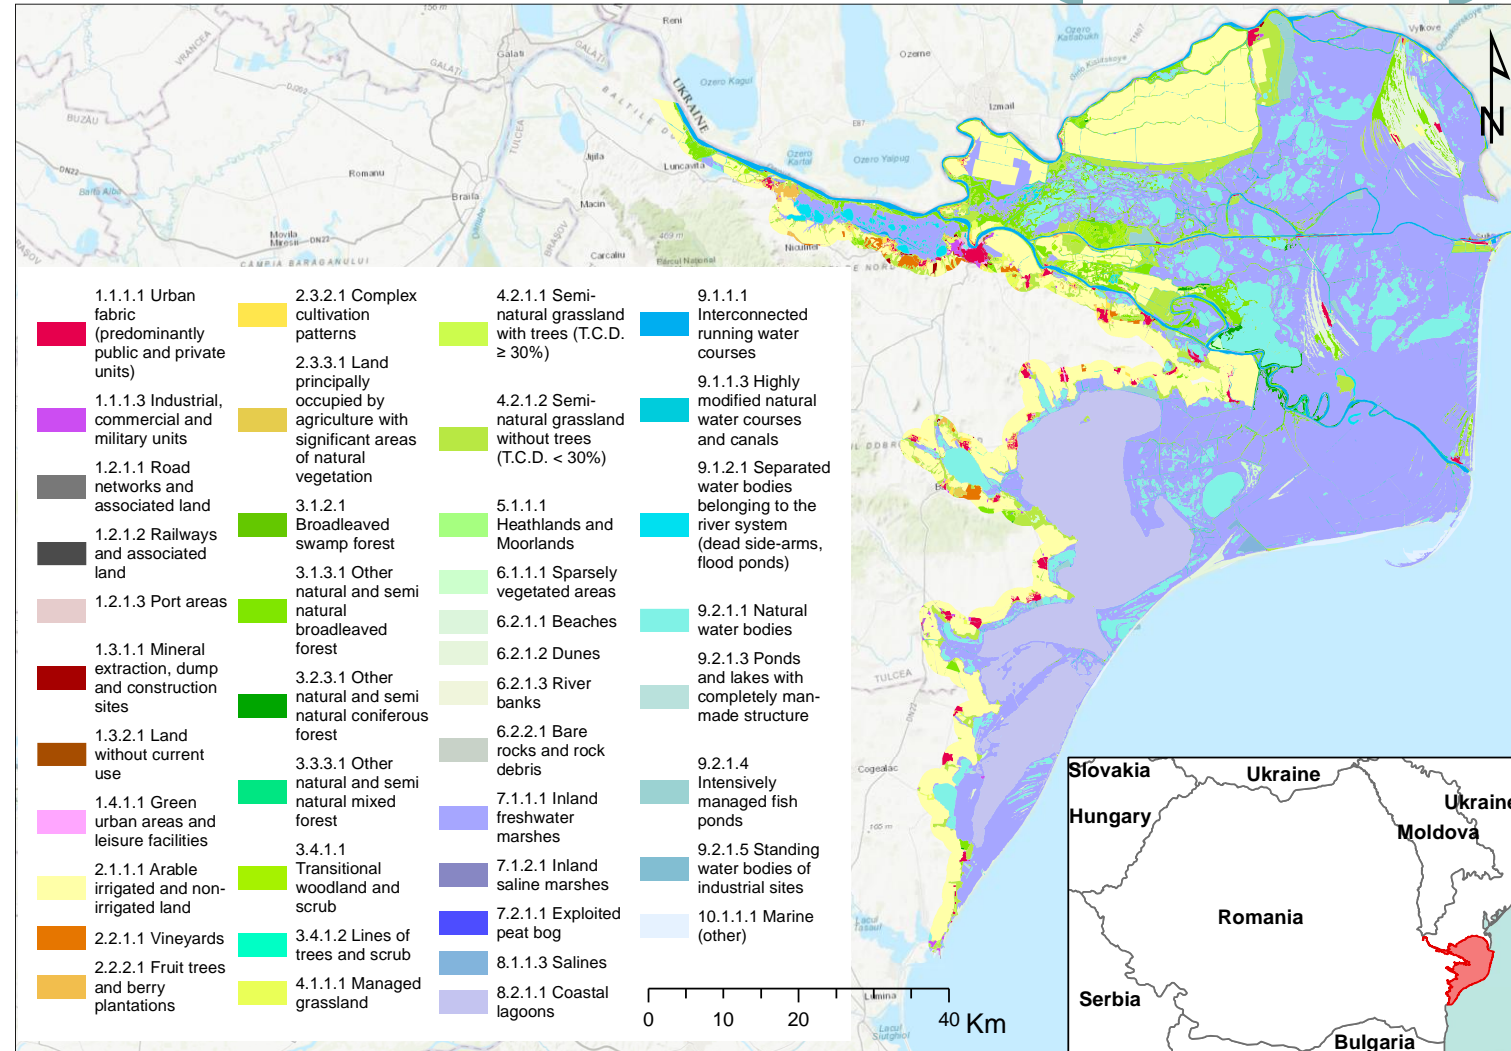

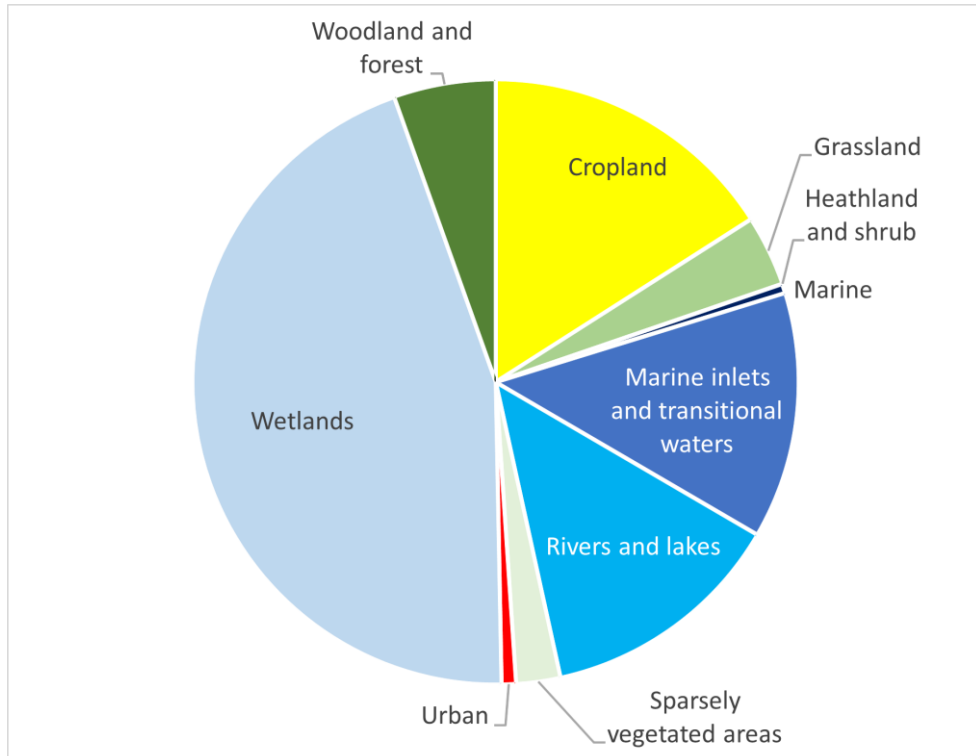

Bayesian Belief Network

Ecosystem types

41 ecosystem types according to MAES level two classification

Stakeholder engagement

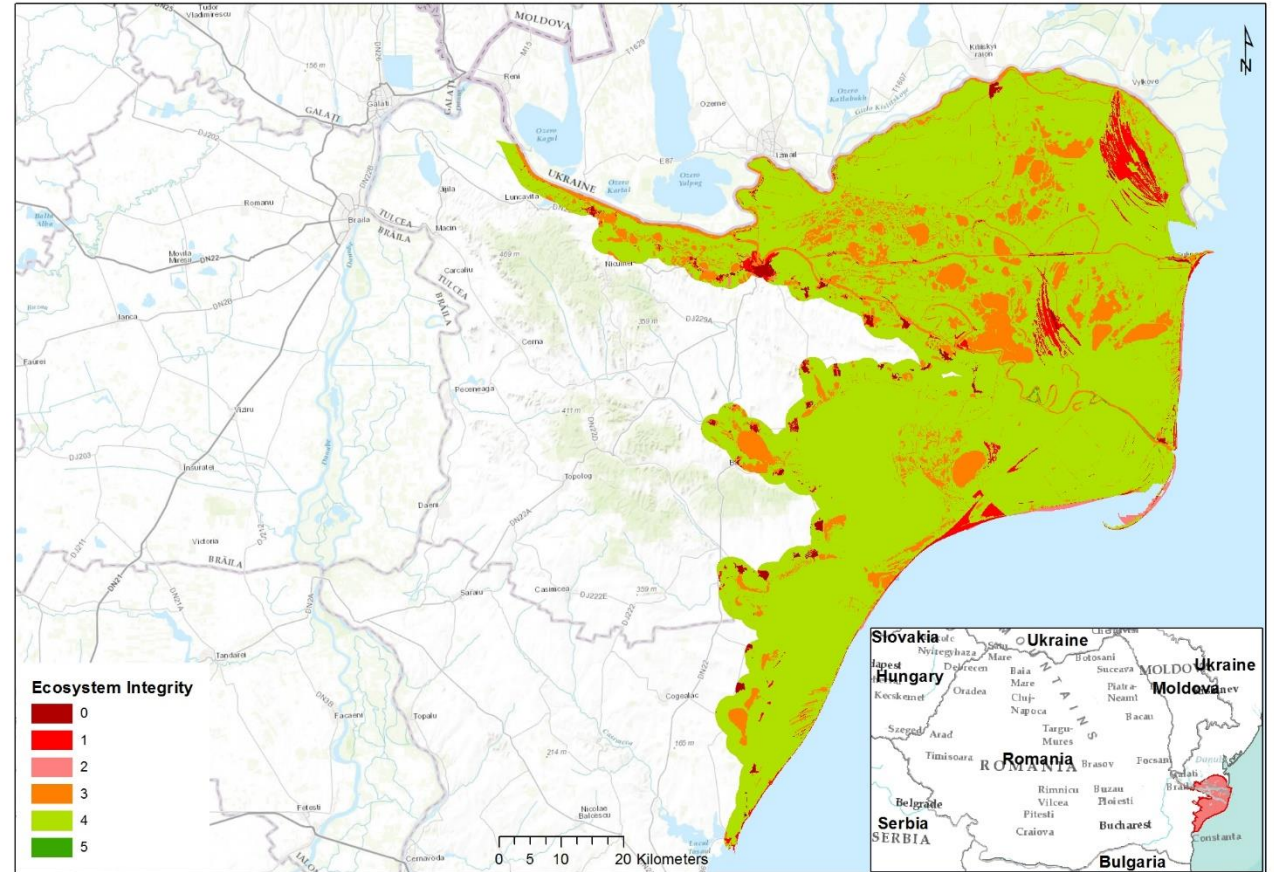

This project has received funding from the *European Union's Horizon 2020 research and innovation programme* under grant agreement No 641762

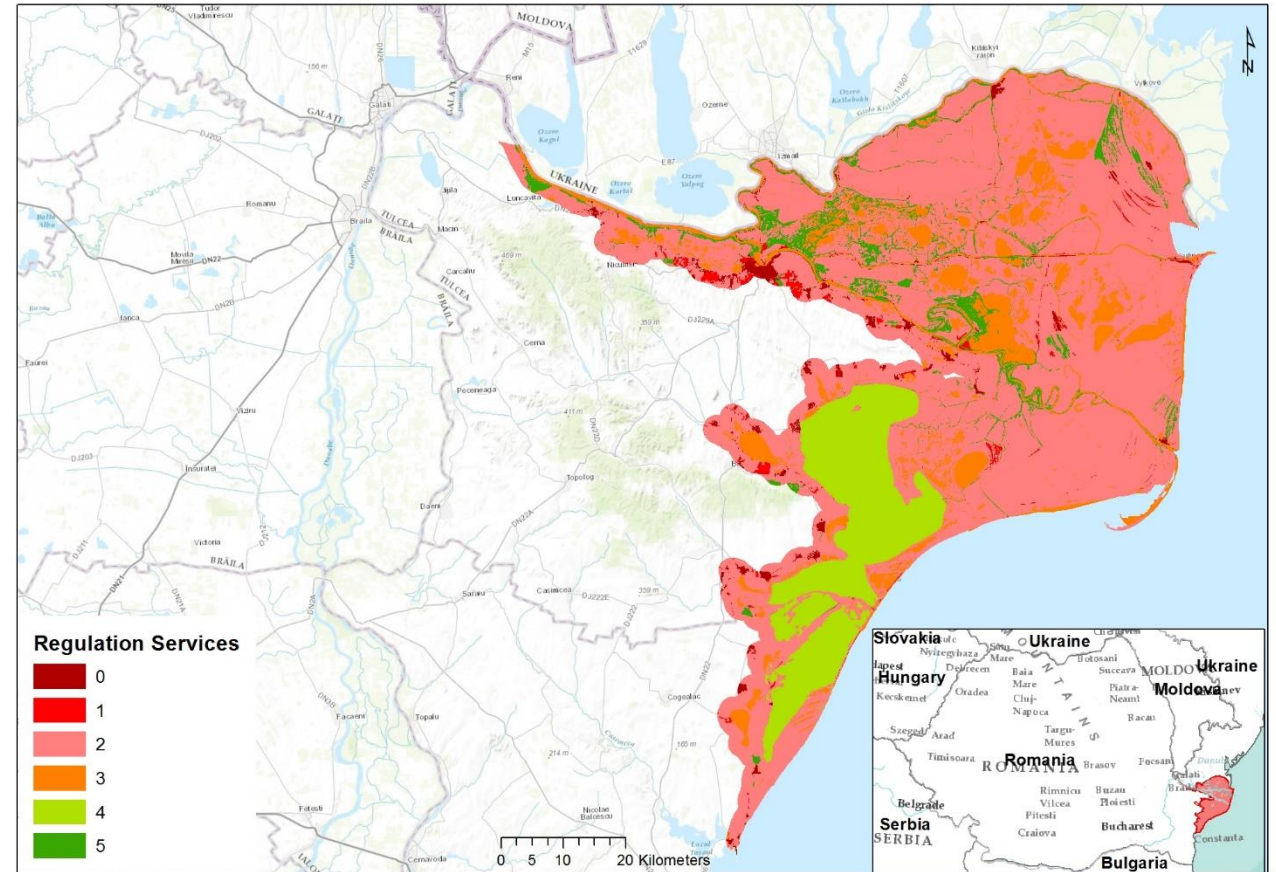

Ecological Integrity

- Exergy Capture (Radiation)
- Entropy production
- Storage capacity (SOM)
- Reduction of Nutrient loss
- Biotic waterflwos
- Metabolic efficiency
- Abiotic heterogeneity
- Biodiversity

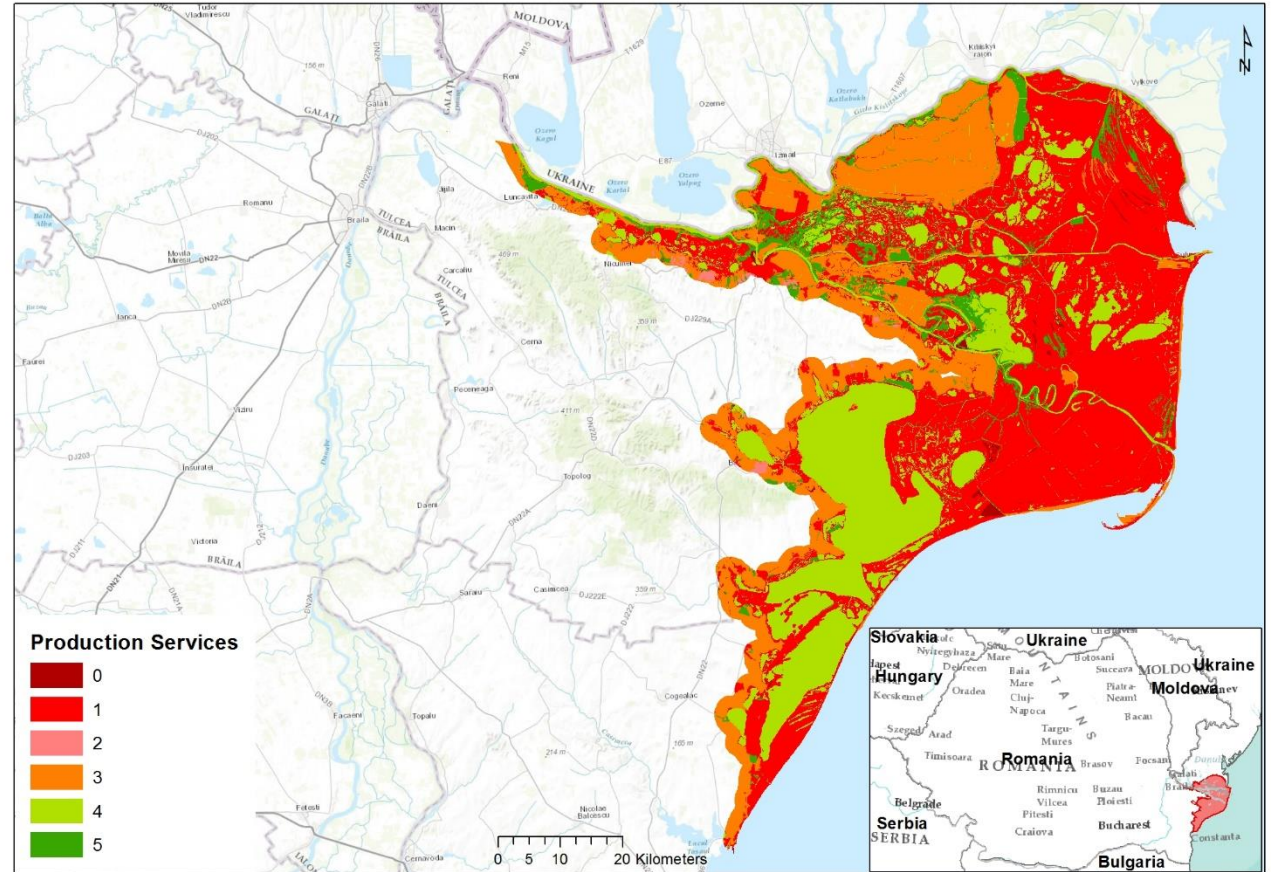

Regulating Services

- Global climate regulation
- Local climate regulation
- Air Quality Regulation
- Water flow regulation
- Water purification
- Nutrient regulation
- Erosion Regulation
- Natural hazard protection
- Pollination
- Pest and disease control
- Regulation of waste

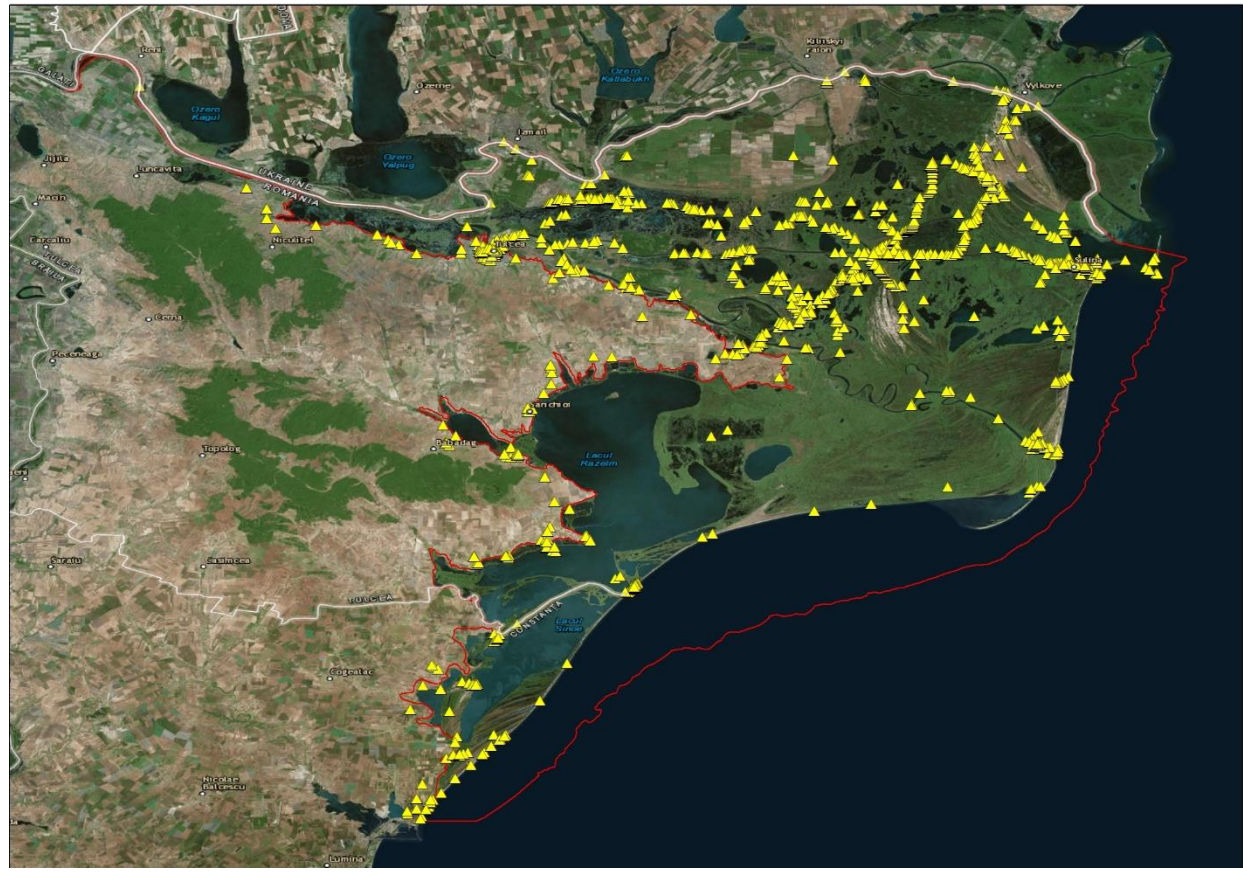

Provisioning Services

- Crops
- Energy (Biomass)
- Fodder
- Livestock
- Fiber
- Timber
- Wood Fuel
- Capture Fisheries
- Aquaculture
- Wild Foods
- Biochemicals / Medicine
- Freshwater
- Mineral resources
- Abiotic energy sources

Social media used to reveal the cultural services

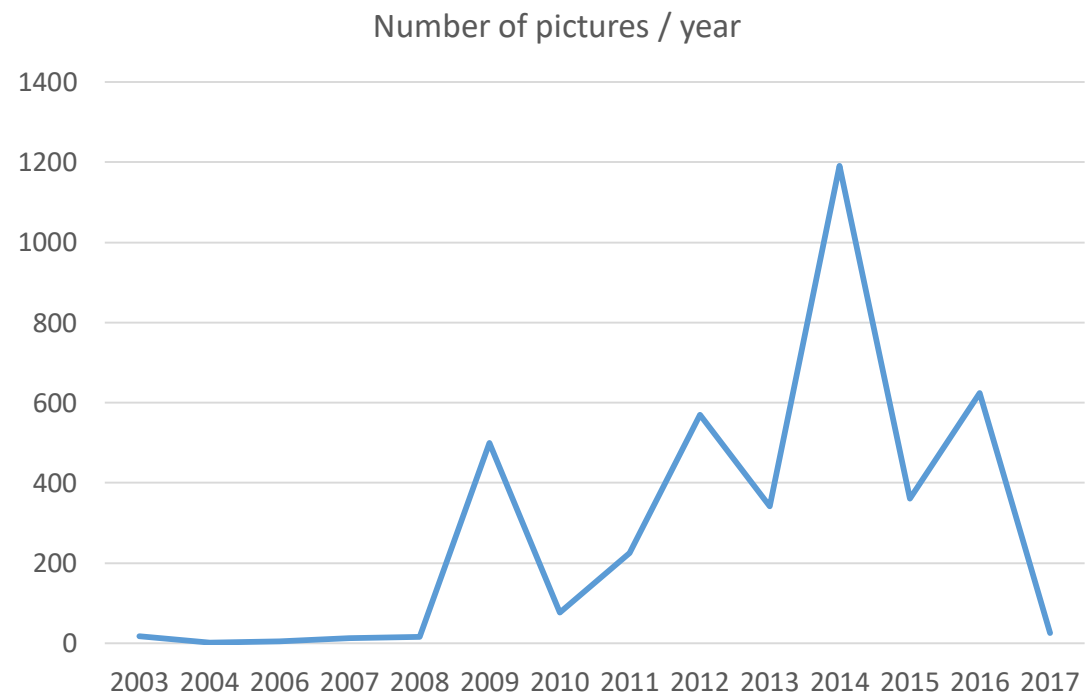

Physical interactions	Wild species, invertebrates Wild species, vertebrates Non-wild species (cattles, sheep, etc.) Plant species/Vegetation Landscape appreciation Other
Experiential interactions/Activities	Bird watching Swimming/Diving/Snorkelling Hiking Boating/Cayaking Leisure fishing and hunting Biking Camping Other
Intellectual and representative interactions	Educational Scientific Heritage, cultural Entertainment Aesthetic Inspirational Bequest Other
Spiritual and/or emblematic	Symbolic Sacred and/or religious Other

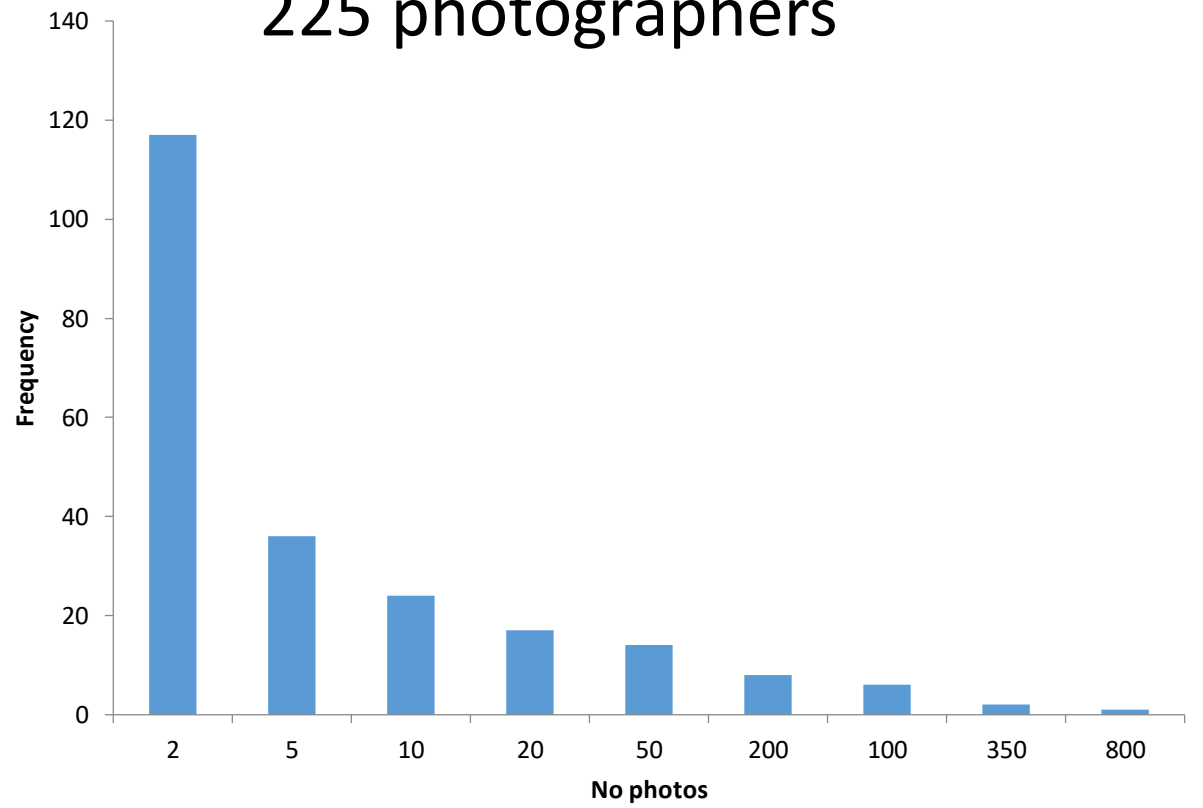

This project has received funding from the *European Union's Horizon 2020 research and innovation programme* under grant agreement No 641762

Social media used to reveal the cultural services

3965 unique pictures

225 photographers

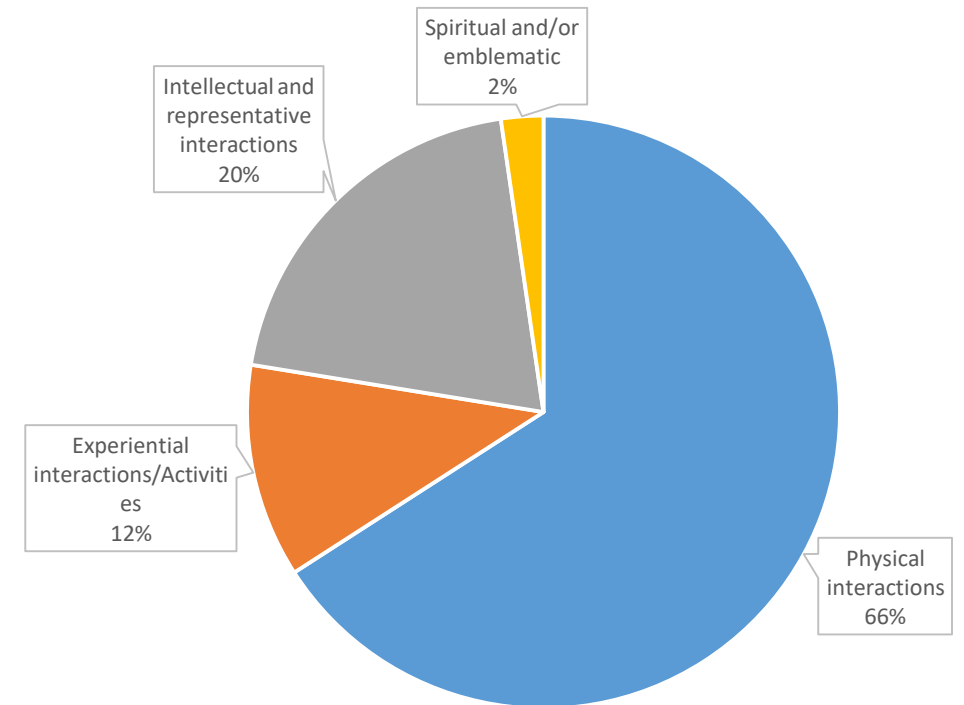

Social media used to reveal the cultural services

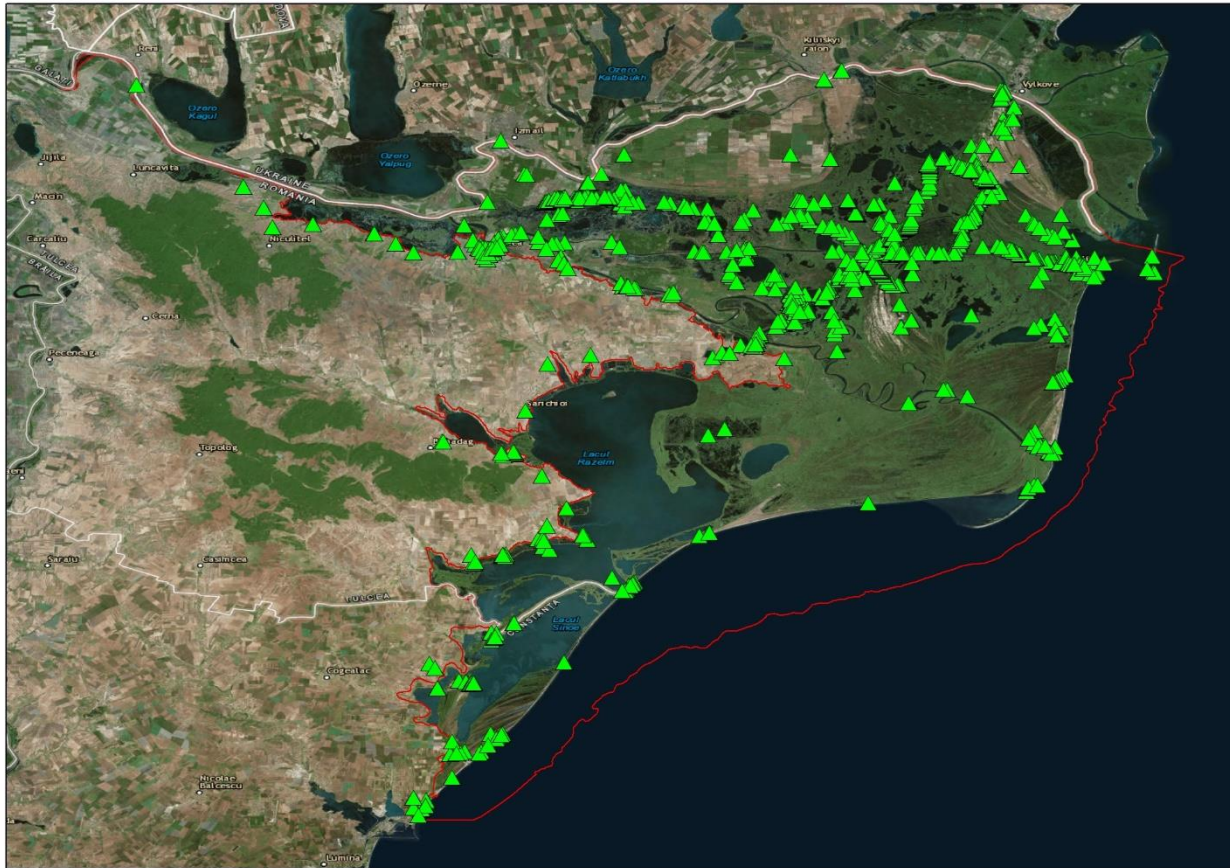

Pictures per seasons

Pictures per categories

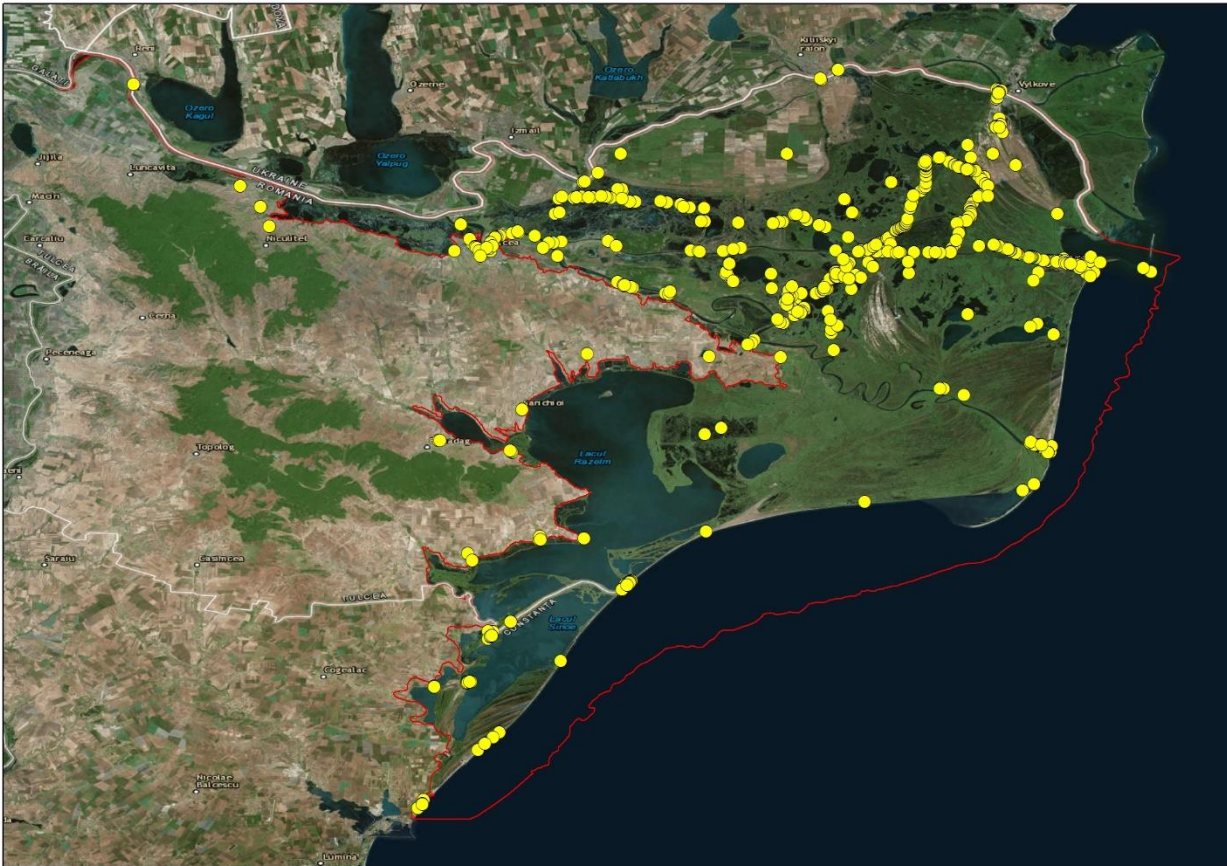

Physical interactions

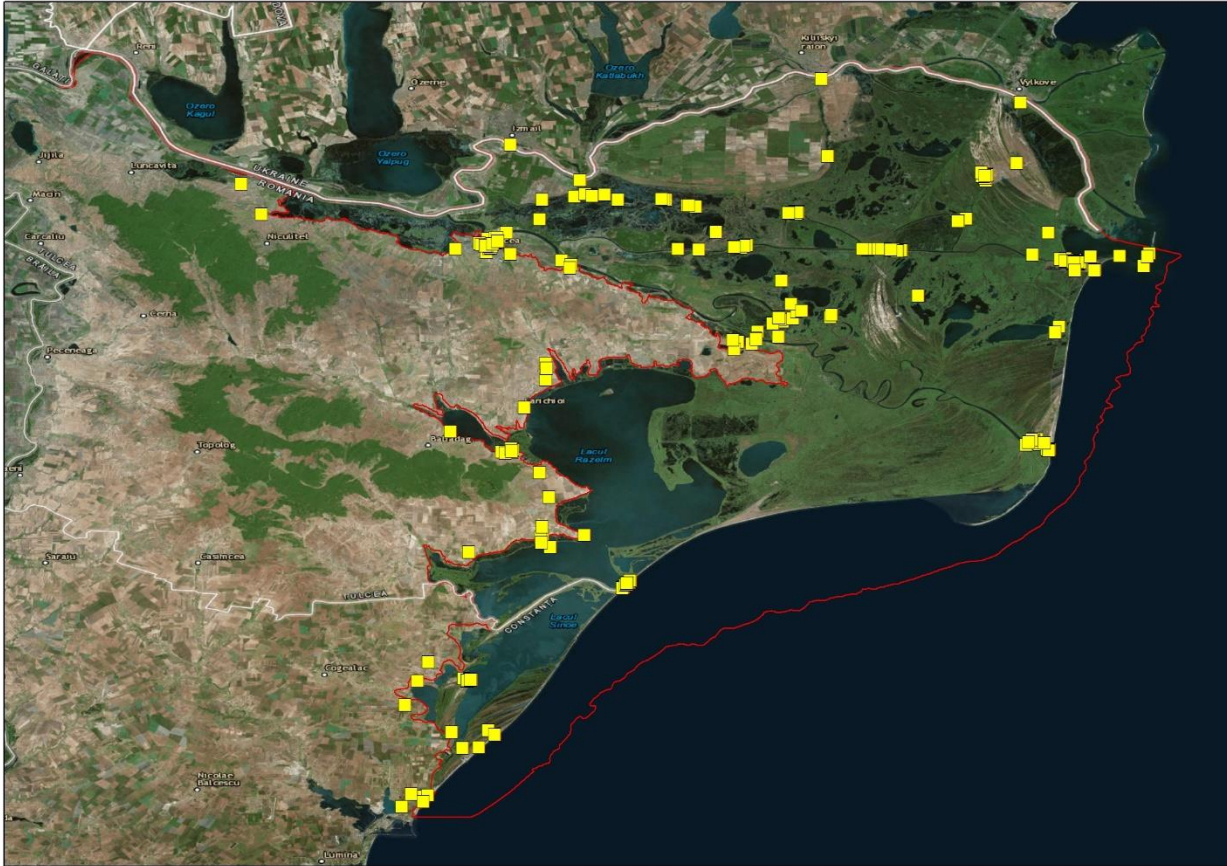

Physical interactions - winter

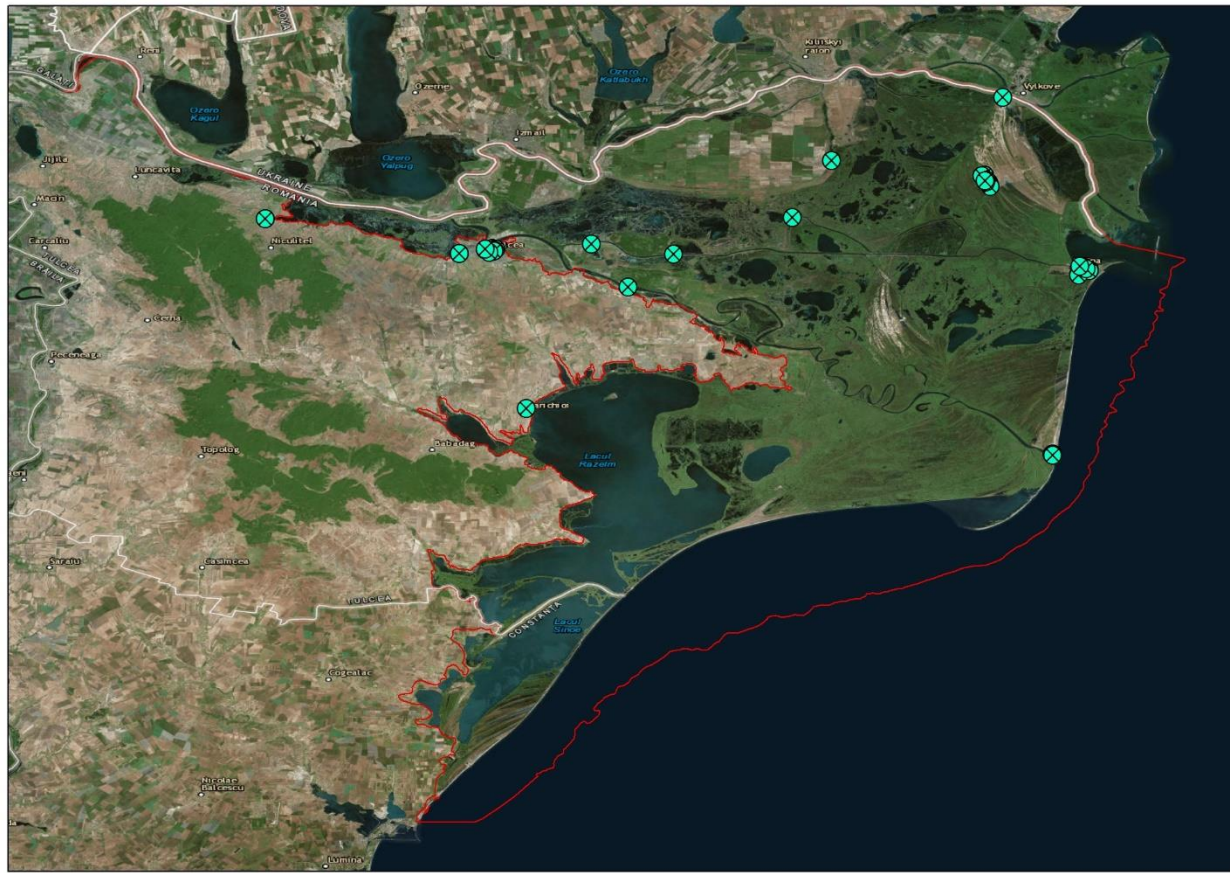

Physical interactions - summer

Intellectual and representative interactions

Spiritual and/or emblematic

Conclusions

- We found out that remote sensing is useful for identification of the ecosystem types and their distribution. The advantage to use remote sensing is also that we can assess the changes that may occur on short time (e.g. hydroperiod, distribution of chlorophyll, gross primary production for terrestrial ecosystems).
- There is still need for remote sensing derived products that can be used as proxies for water quality of the shallow water or marshy areas.
- We empirically observed that ecosystem productivity has an influence on the distribution of visitors within protected areas, and the scenery of landscape is the most attraction of the Danube Delta.

To do

- Spatial BBN including EO products
- Refinements of the potential of ecosystems to provide various services
- Compare the manually photoseries classification to the automate algorithms (e.g. google api)

Thank you!
